

# EAT24 Project

---

by Apostolos Lalos

The current project is done in HTML5, CSS and PHP. Hosted at **localhost/eat24** using WAMP.

It is a single page project since I implement **\_SESSION** because I wanted to test and avoid multiple pages.

The user can:

- Login on the system via the **Login Form** on the right top corner of the webpage. For simplicity, any credentials are accepted. No security implemented yet. Just put a username and a password.

- Now there is an opened SESSION to the system. The user can navigate freely.
- Logout, using the logout button. The SESSION is closed and the user is logged out from now on.
- Search one of the three categories in the **Search bar Form**. The categories are burgers/drinks/ice cream.

---

Search:

Otherwise an Error message appears.

- Navigate the three product categories through the navigation bar.
